NAME

      epsffit − fit encapsulated PostScript file (EPSF) into constrained size

SYNOPSIS

      epsffit [**−c**] [**−r**] [**−a**] [**−m**] [**−s**] *llx lly urx ury* [*infile* [*outfile*]]

DESCRIPTION

      Epsffit fits an EPSF file (encapsulated PostScript) to a given bounding box. The coordinates of the box are given by (*llx*,*lly*) for the lower left, and (*urx*,*ury*) for the upper right, in PostScript units (points).

      If no input or output files are specified, **epsffit** reads from the standard input and writes to the standard output.

OPTIONS

      −c   Center the image in the given bounding box.

      −r   Rotate the image by 90 degrees counter-clockwise.

      −a   Adjust the aspect ratio to fit the bounding box. The default is to preserve the aspect ratio.

      −m   Rotates the image to maximise the size if it would fit the specified bounding box better.

      −s   Add a **showpage** at the end of the file to force the image to print.
